

ABSTRACT OF THE DISCLOSURE

A front suspension fork for bicycles includes a crown portion having two collars and two operation tubes are connected to the two collars. Two main tubes each have an open top through which two resilient
5 members and the two operation tubes are received. A bridge is integrally formed in one piece formation with the two main tubes. The bridge is located in the same plane with the two main tubes and the two collars. The bridge has a curve top which has the same curvature as a lower profile of the crown portion.
